

Overview of a marine radioactivity database and data management

Paul Morris

**Department of Nuclear Sciences and Applications
Environment Laboratories, Monaco**

MARiS – Marine Information System

- This presentation is orientated towards the IAEA's open access database of marine radionuclides (MARiS): maris.iaea.org

Presentation objectives

- To define database jargon:
 - data vs. datum
 - data and metadata
 - fields and records
 - datasets and databases
- To shed some light on databases and take you behind the scenes
- To distil data management to its component parts
- To demonstrate why we should care about archiving data?

Database talk outline

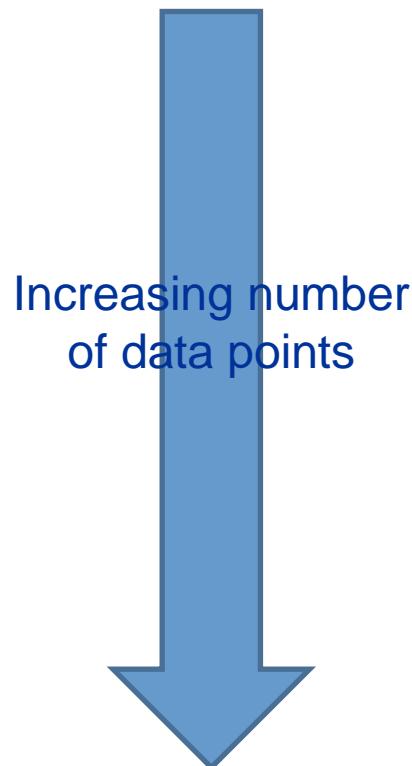

- Part 1 – What is data and why is metadata so important?
- Part 2 – From datasets to databases
- Part 3 – The MARiS database and data network

What is/are datum/data?

- Singular datum vs. plural data
 - Traditionally data is the plural of the singular datum
 - However, data is now commonly accepted as the singular and plural version of the noun
 - The internet is full of linguistic discussions about the word datum and data
 - The best approach is to be consistent in your own usage use the words data and datum

So, what is data?

- Is it:
 - Measurement?
 - Information?
 - Pattern?
 - Knowledge?

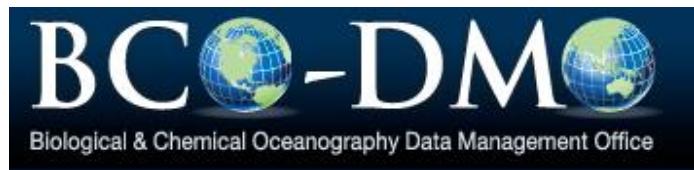

What is data?

- A single data point is a measurement of a parameter, for example:
 - The temperature of seawater: 20 °C
 - The length of a fish: 30 cm
 - The salinity of seawater: 35
 - The concentration of oxygen: 220 µmol L⁻¹
 - The mass of sediment: 3 kg
 - The activity of a radionuclide: 2 Bq m⁻³

What is metadata?

In data processing, metadata is definitional data that provides information about or documentation of other data managed within an application or environment.

The information contained in the metadata should be sufficient to allow another researcher to make use of your data, and, in a sense, to be able to recreate it

- So what does this mean in simple terms?

What is metadata?

- **Metadata is a description of the data**
- 20 °C – Data (measurement)
- Where was it measured? depth, lat, long
- When was it measured? Date and time
- How was it measured? Hg in glass, sensor
- Who measured it? Name, lab, contact info
- Citations to methods, standards used, ancillary measurements, general notes, cruise & station ID, etc.....

What is metadata?

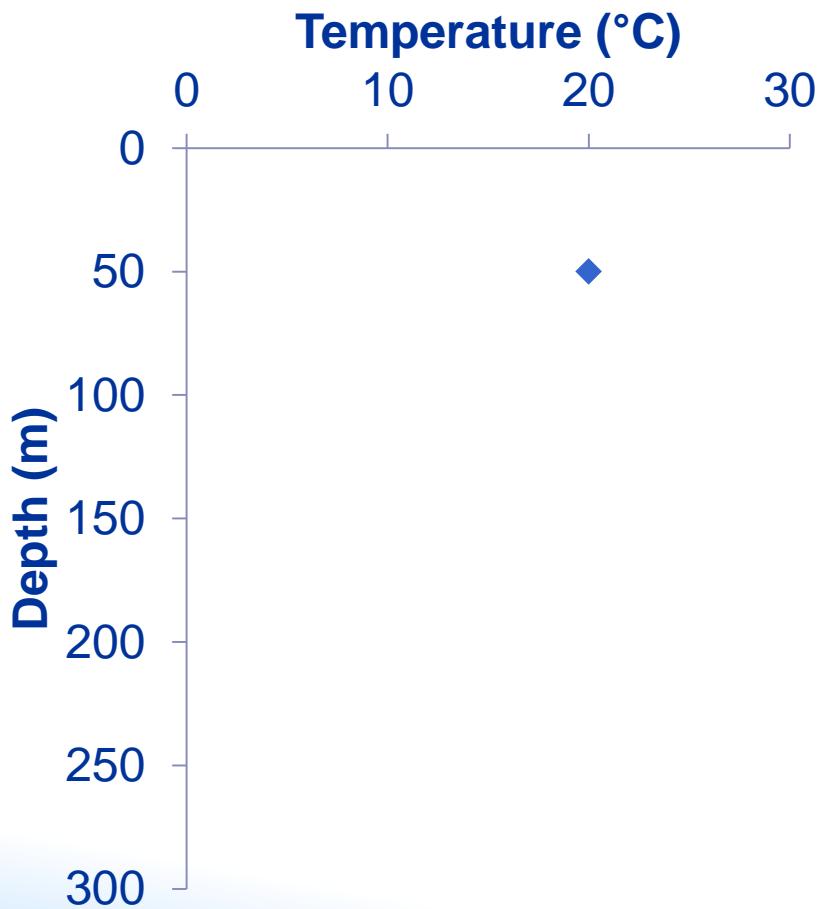

- Metadata informs you about the data to create **context**
- **Without metadata**, the data is of no value because **there is no context**
 - Data originator - traceability
 - Depth
 - Position
 - Date
 - Method
 -

Data in the context of metadata

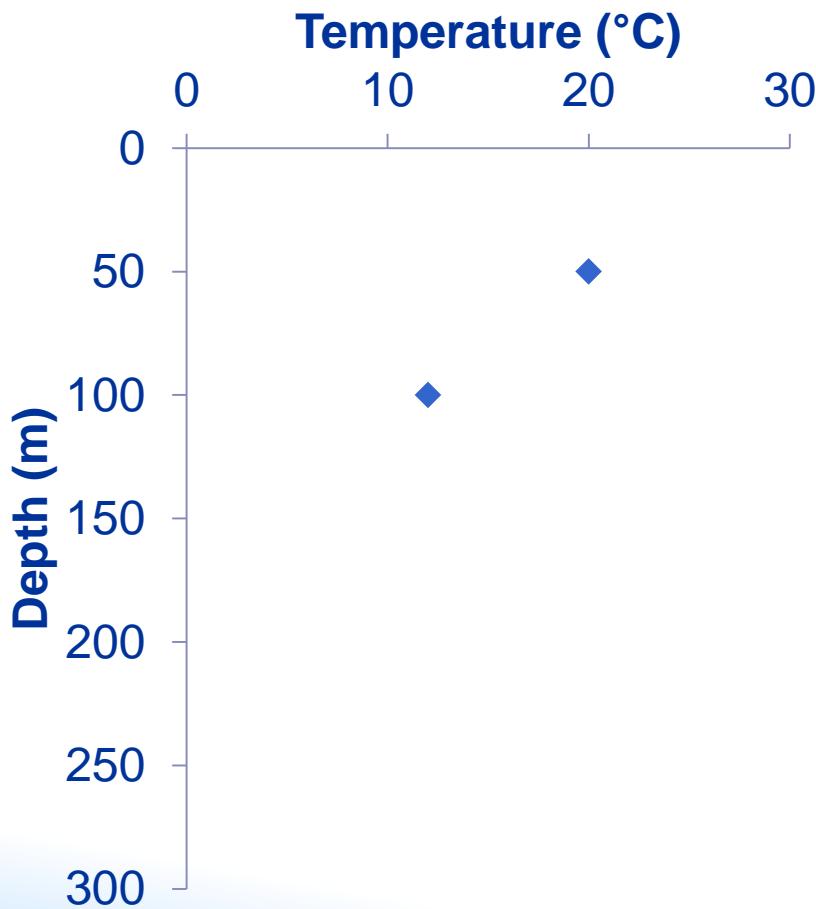

- A measurement is made: temperature is 20 °C
- So we have one data point of temperature
- **Measurement** without context

Data in the context of metadata

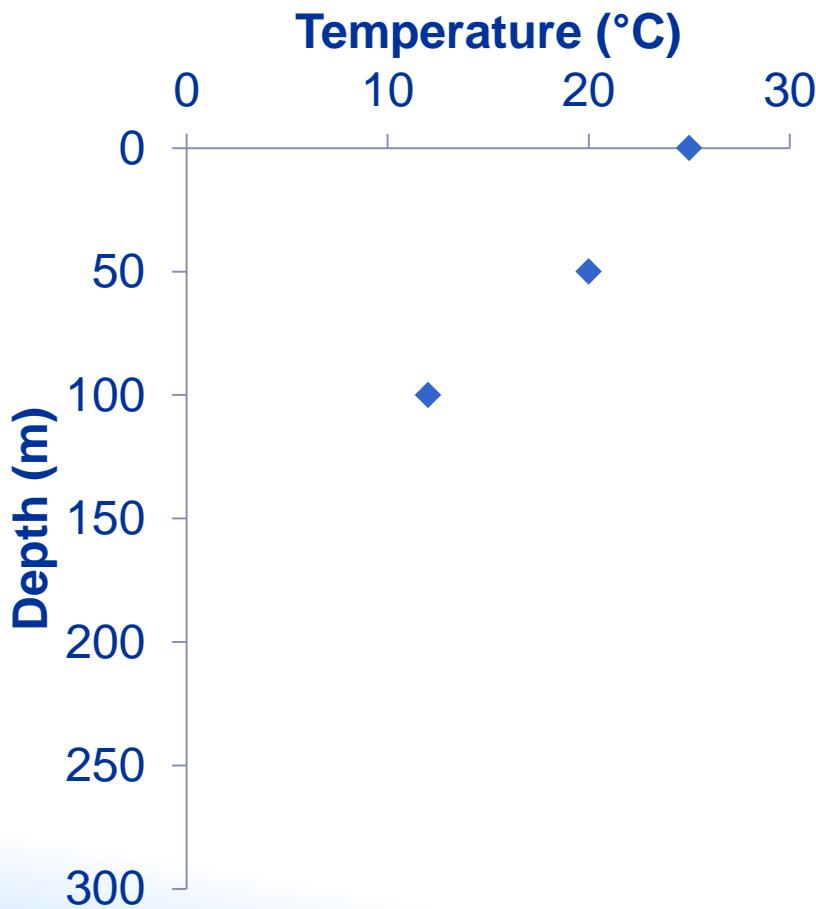

- The measurement depth is 50 m
- Metadata gives context
- The temperature at 50 m is 20°C
- Information requires context (metadata)

Data in the context of metadata

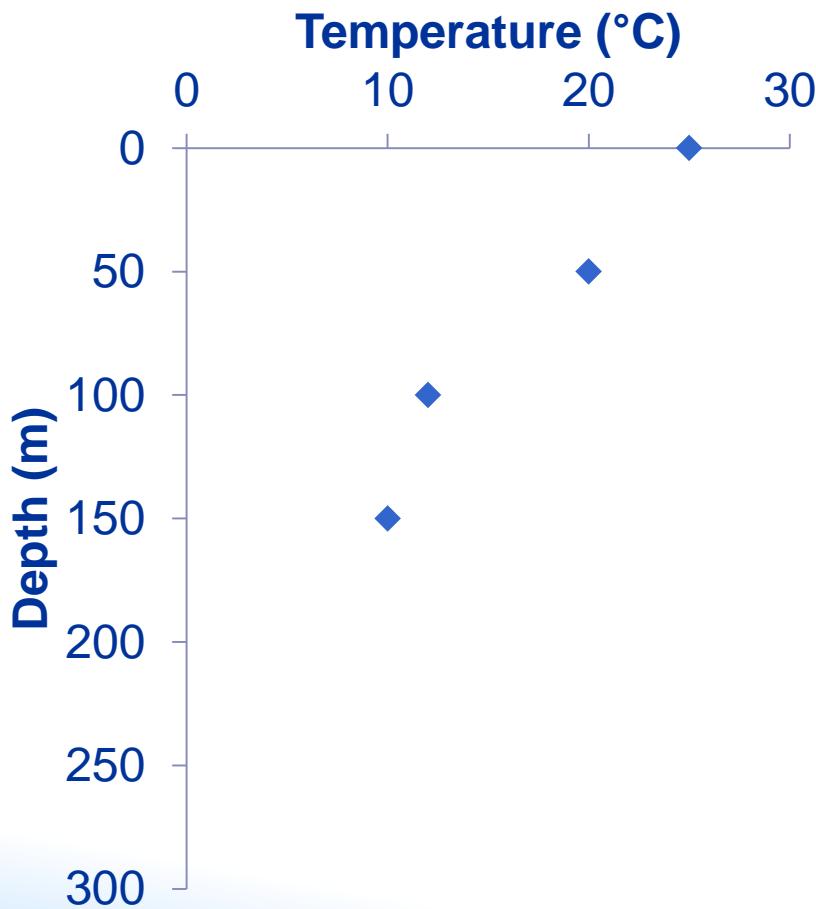

- Add more data in the context of depth to create more information

Data in the context of metadata

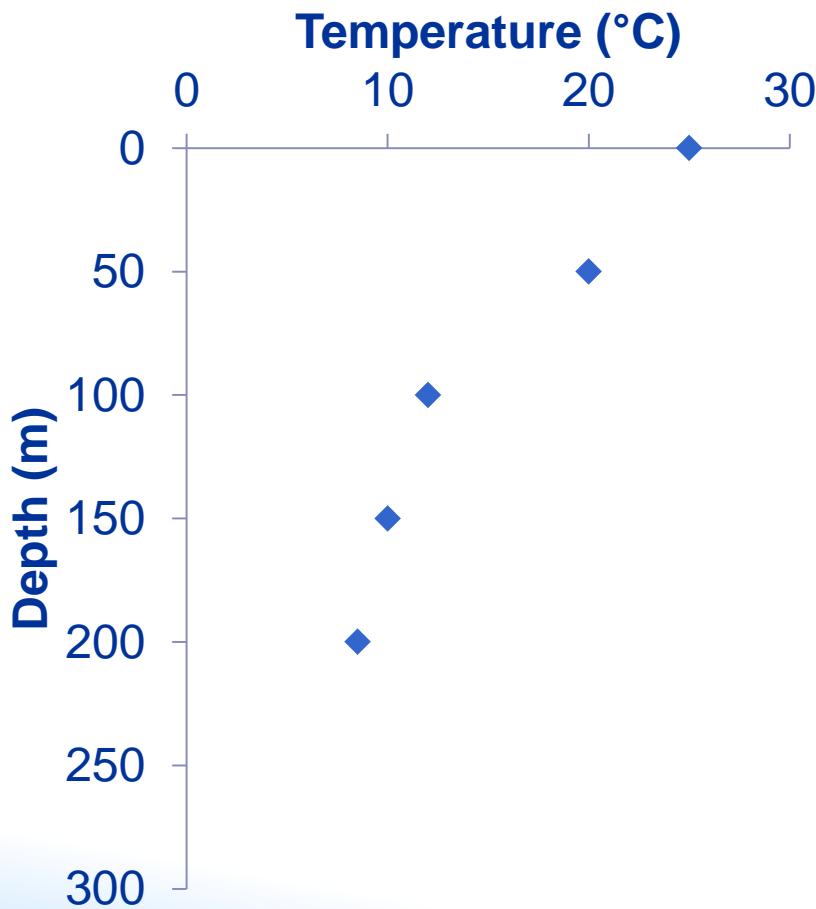

- Add more data in the context of depth to create more information

Data in the context of metadata

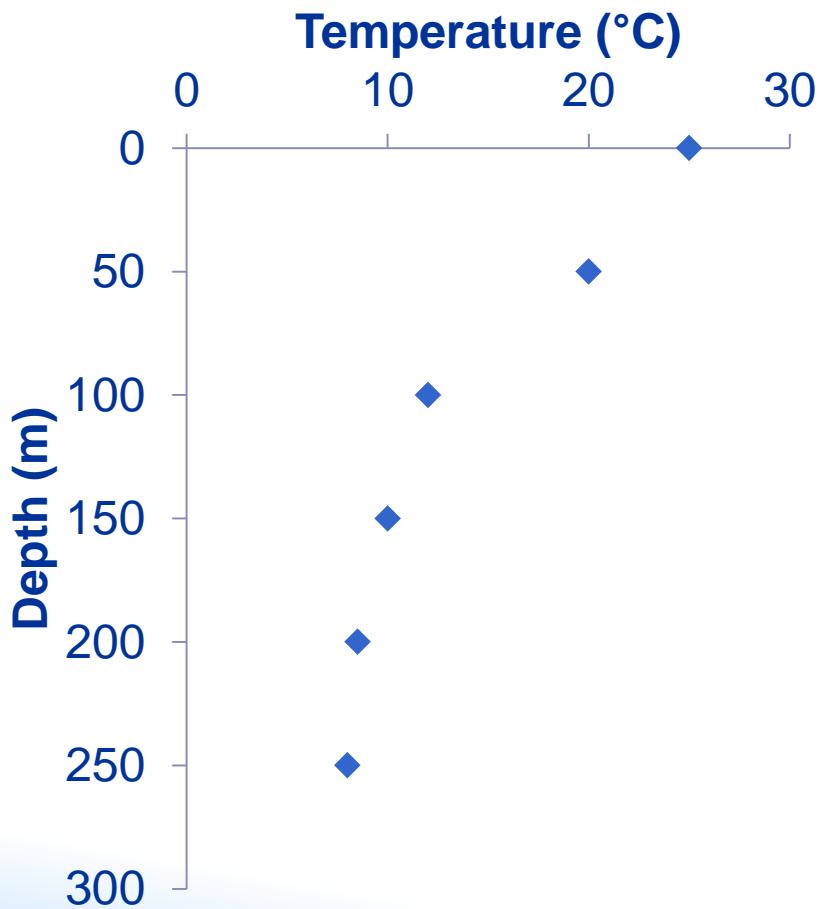

- Add more data in the context of depth to create more information
- **Patterns** emerge as more data is added

Data in the context of metadata

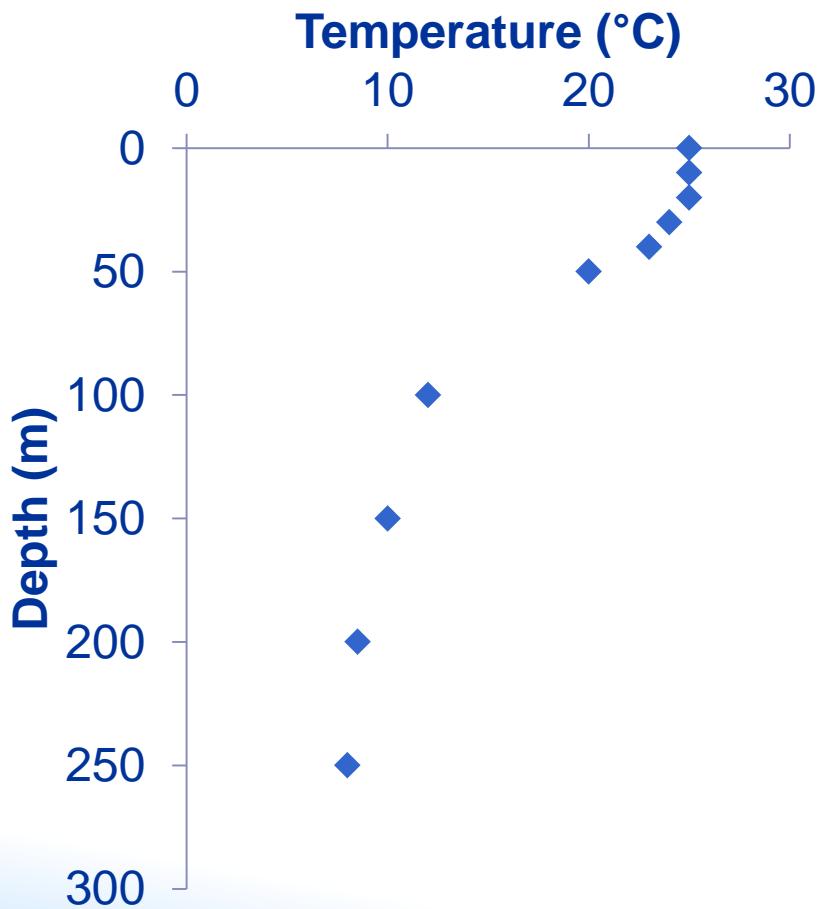

- Add more data in the context of depth to create more information
- **Patterns** emerge as more data is added

Data in the context of metadata

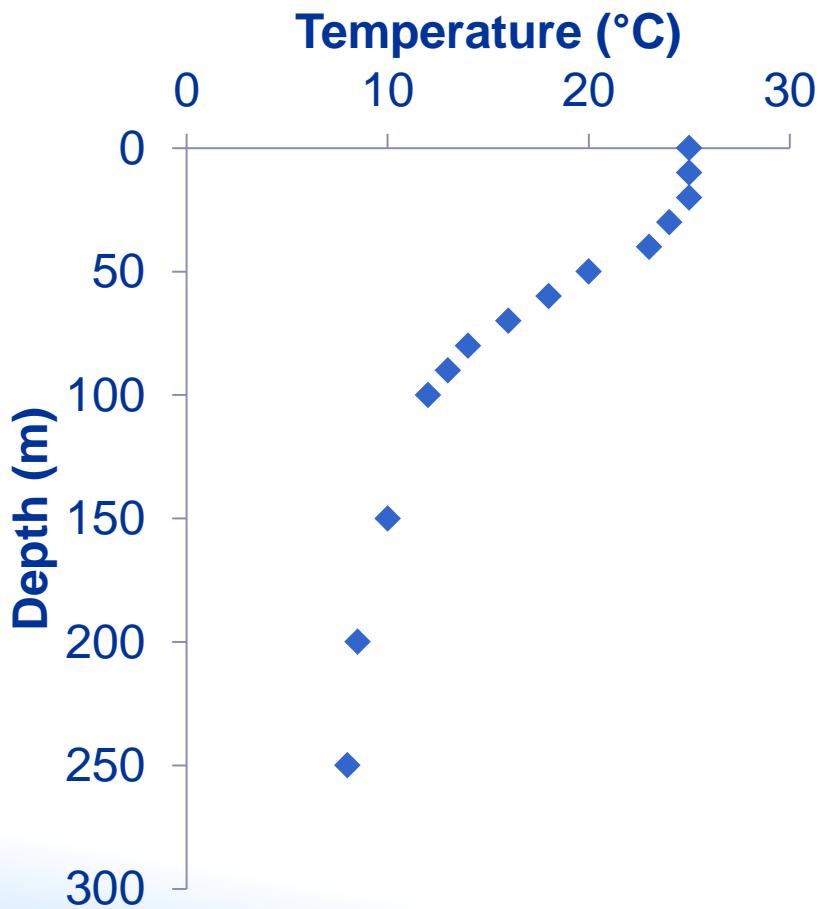

- As the resolution of the data increases, the pattern becomes more detailed

Data in the context of metadata

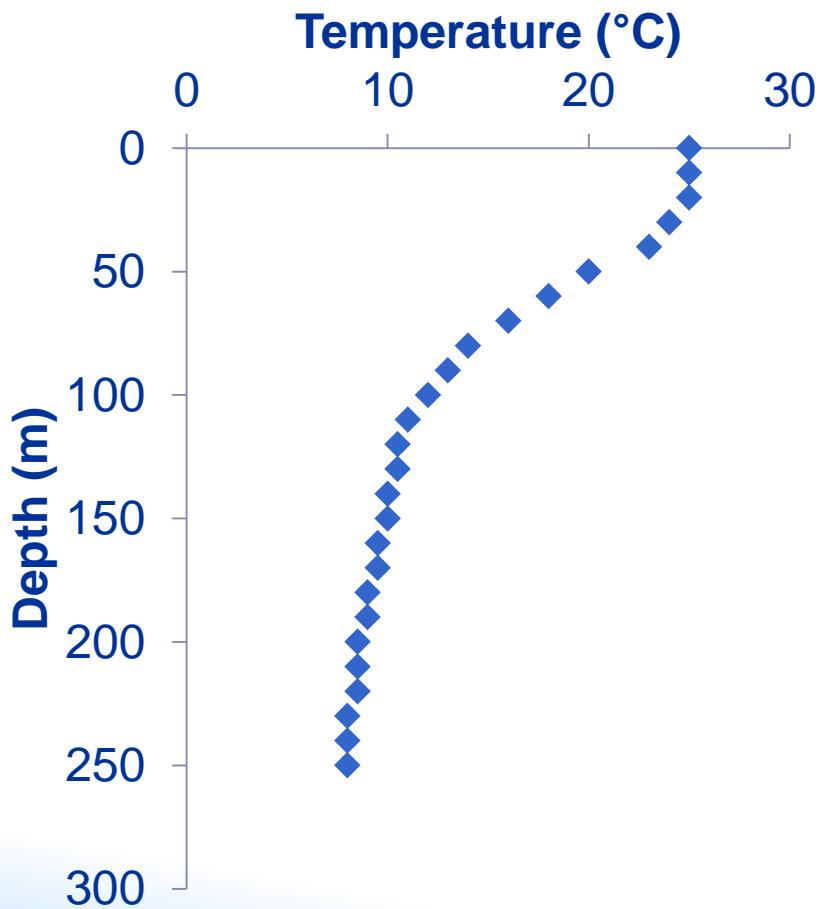

- As the resolution of the data increases, the pattern becomes more detailed

Data in the context of metadata

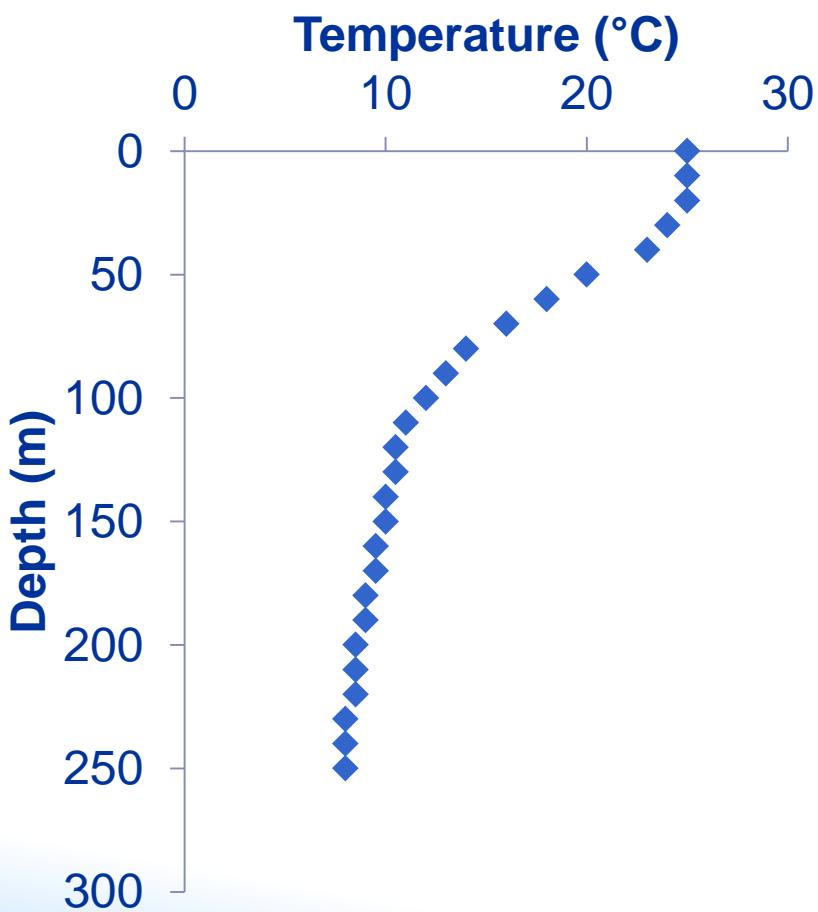

- As the resolution of the data increases, the pattern becomes more detailed

Data in the context of metadata

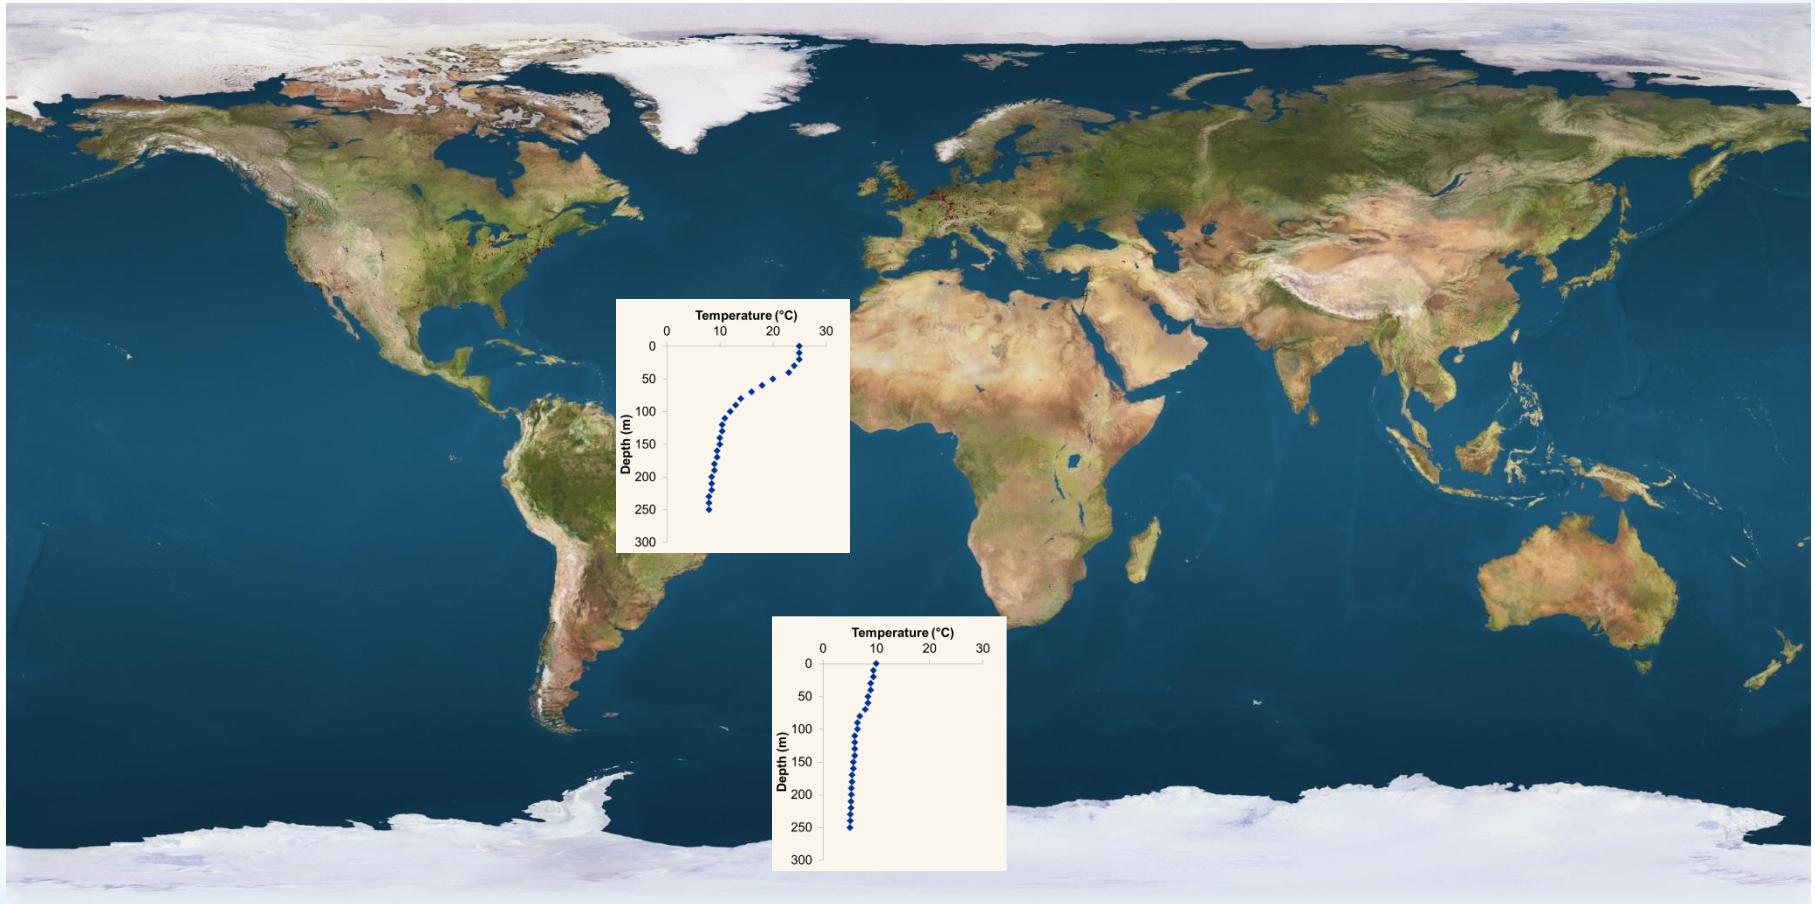

- As the resolution of the data increases, the pattern becomes more detailed
- Patterns in data provide **knowledge**
- 1 metadata parameter of depth

Data in the context of spatial metadata

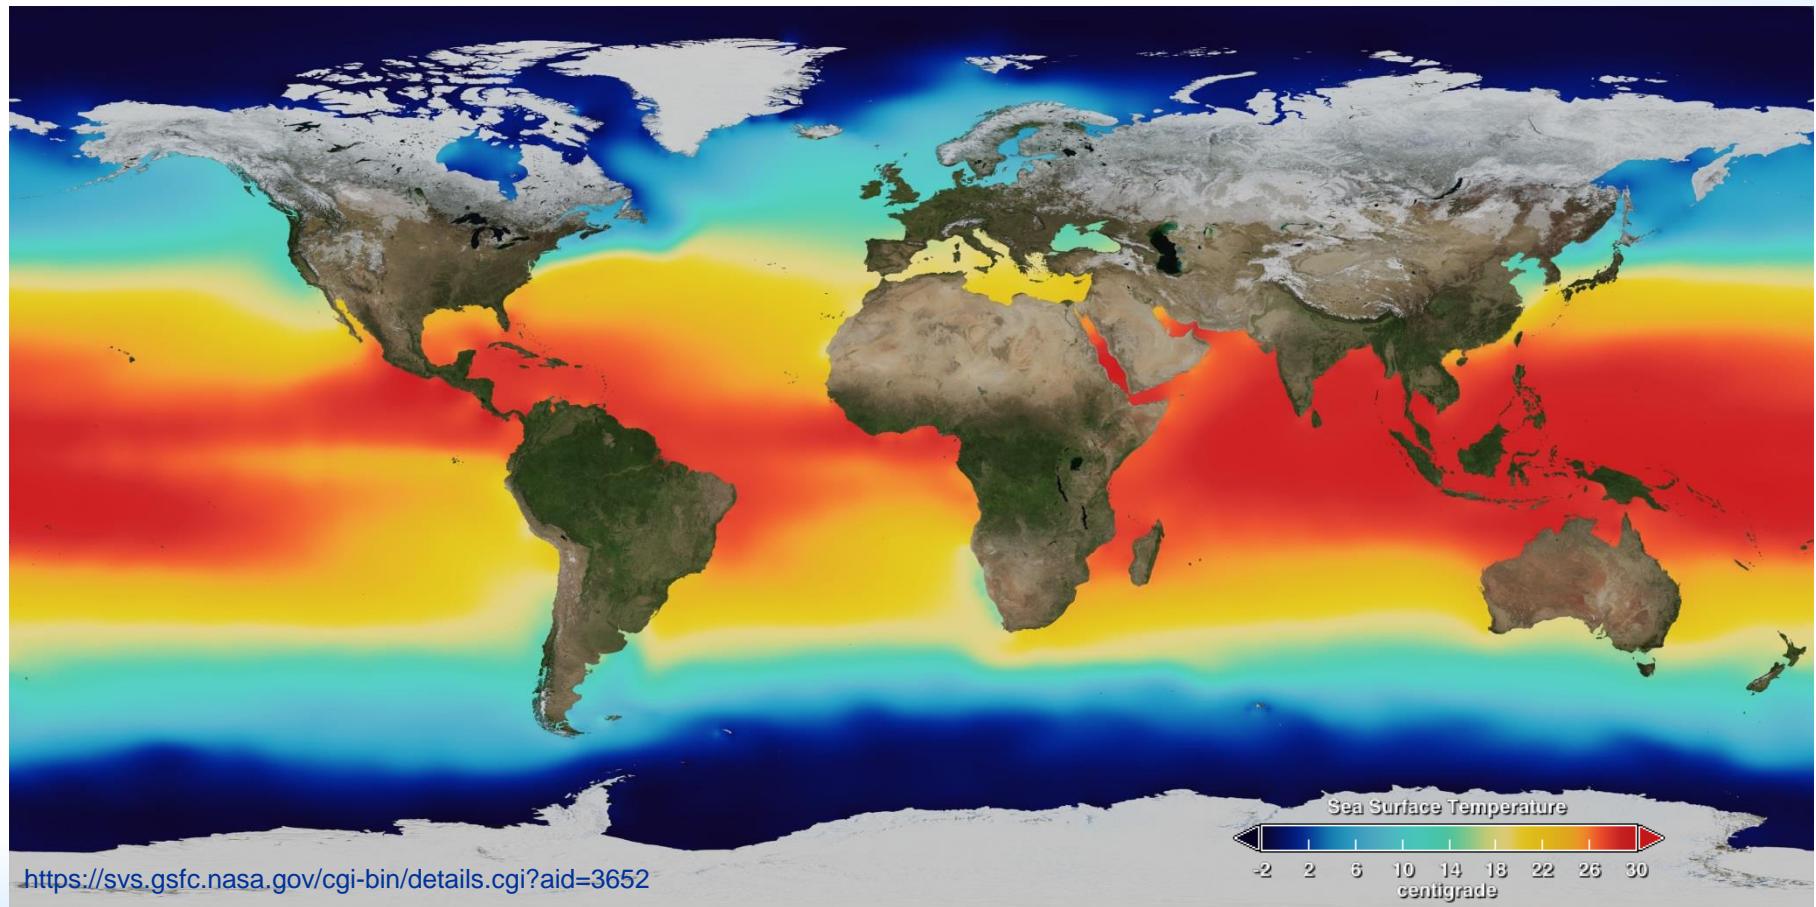

- Add spatial metadata
 - Latitude and Longitude

Data in the context of spatial metadata

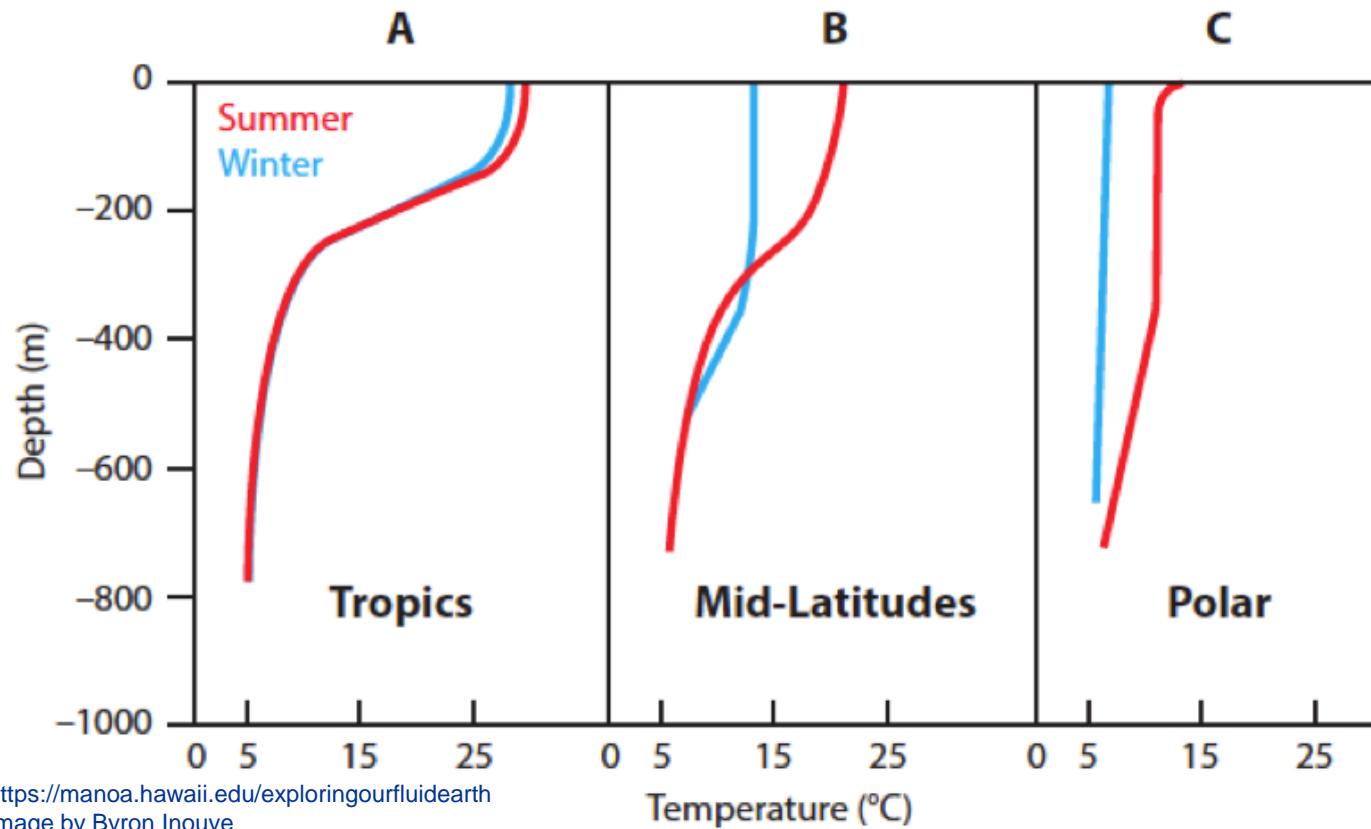

Data in the context of spatial metadata

Data in the context of temporal metadata

- Add temporal metadata: date and time

Data and metadata

- Treat data & metadata with **equal importance**
- Submitted data often lacks basic metadata e.g.:
 - Latitude and longitude
 - Sampling depth
 - Sampling date
 - Dates are easily confused: 09/06/16
 - 9th June 2016 or September 6th 2016?
 - The best format for dates has lettered months: dd-mmm-yyyy
 - e.g. 09-Jun-2016

Metadata requirements

Seawater	Notes
Measurement ± Uncertainty	Data ± Uncertainty
Reference/citation	Fundamental metadata
Measurement type (=,<,ND)	
Unit	Without any one of these the data <u>cannot</u> be included in MARiS
Nuclide	
Date Sampled	
Latitude	
Longitude	
Sampling depth	
Laboratory	Highly informative metadata to include with the data
Collection method	
Sample prep method	
Counting method	
Salinity	
Temperature	
Sample lab code	Good to have and provides further useful context for data search and interpretation
Total water depth	
Station	
Cruise	
Sample volume	
Filtered	Other ancillary metadata fields exist in MARiS but are less used
Acidified	
Other fields	

Metadata requirements

Seawater	Sediment	Biota	Suspended matter	Notes
Measurement ± Uncertainty	Measurement ± Uncertainty	Measurement ± Uncertainty	Measurement ± Uncertainty	Data ± Uncertainty
Reference/citation	Reference/citation	Reference/citation	Reference/citation	Fundamental metadata
Measurement type (=,<,ND)	Measurement type (=,<,ND)	Measurement type (=,<,ND)	Measurement type (=,<,ND)	Without any one of these the data cannot be included in MARiS
Unit	Unit	Unit	Unit	
Nuclide	Nuclide	Nuclide	Nuclide	
Date Sampled	Date Sampled	Date Sampled	Date Sampled	
Latitude	Latitude	Latitude	Latitude

Filtered	Organic content			
Acidified	Oxic/Anoxic			

From a dataset to a database

Casacuberta et al. (2013) Biogeosciences, 10, 3649–3659

Station	Sample code	Collection date	Depth(m)	Longitude	Latitude	90Sr(Bq/m3)	90Sr Error	89Sr(Bq/m3)	89Sr Error
19	Sr-20	12.06.2011	200	142.9980	37.4940	0.8	0.2		
19	Sr-21	12.06.2011	100	142.9980	37.4940	1.7	0.2		
19	Sr-22	12.06.2011	50	142.9980	37.4940	4.7	0.4		
19	Sr-23	12.06.2011	20	142.9980	37.4940	8.1	0.4	25	4
20	Sr-24	13.06.2011	2	143.0016	37.6000	1.7	0.2		
21	Sr-25	13.06.2011	2	142.2947	37.3008	7.4	0.4	22	9
23	Sr-32	14.06.2011	100	142.0050	37.4810	4.8	0.7		
23	Sr-33	14.06.2011	50	142.0050	37.4810	34	2	137	43
23	Sr-34	14.06.2011	20	142.0050	37.4810	37	3	132	34
23	Sr-35	14.06.2011	10	142.0050	37.4810	28	1	65	21
24	Sr-36	14.06.2011	2	141.5984	38.0004	2.5	0.2		
25	Sr-37	15.06.2011	2	141.2673	37.3187	17	1	29	13

- Example dataset – flat single spreadsheet (Table in paper or supp. info)
- Contains all the necessary fundamental metadata
- The text of the paper contains much of the highly informative metadata
- Focus on a small number of samples

From a dataset to a database

Casacuberta et al. (2013) Biogeosciences, 10, 3649–3659

Station	Sample code	Collection date	Depth(m)	Longitude	Latitude	90Sr(Bq/m3)	90Sr Error	89Sr(Bq/m3)	89Sr Error
23	Sr-33	14.06.2011	50	142.0050	37.4810	34	2	137	43
23	Sr-34	14.06.2011	20	142.0050	37.4810	37	3	132	34
23	Sr-35	14.06.2011	10	142.0050	37.4810	28	1	65	21

- The data and metadata can be broken into **unique** and **repeating** components
 - Red highlights unique entries
 - Green highlights repeated entries
- The repeated entries can be separated out from the dataset, placed in a new table and entered only once

From a dataset to a database

- Why make the effort reorganise the dataset?
 - Removes repetition – more efficient
 - Easier to manage – update one record instead of many
 - Easier to search for data & metadata
- But, the links between the separated records have to be re-established or related
 - This forms the basis of a **relational database**

MARiS - data

- Data originates from
 - Databases of collaborating institutes
 - Reports
 - Published scientific literature
- New data entered into the database
 - New data is entered into GLOMARD*
 - *GLOMARD (Global Marine Radioactivity Database) is the IAEA's in-house database
 - Data is checked and validated
 - Data eligible for public release is then uploaded into MARiS
- Intellectual property protected
 - Data is traceable to the originator or providing database
 - Clearance to include unpublished data is sought from the data provider
 - An acknowledgement reminder is displayed when data is downloaded

MARiS – status June 2016

- ~173,500 radionuclide activity measurements
 - 91,300 samples
 - 54 references (inc. 10 database contributions)
 - Seawater, sediment, biota and suspended matter
 - Main nuclides: ^{137}Cs , ^{134}Cs , ^{90}Sr , $^{239,240}\text{Pu}$, ^3H , ^{14}C
 - >60 natural and anthropogenic radionuclides

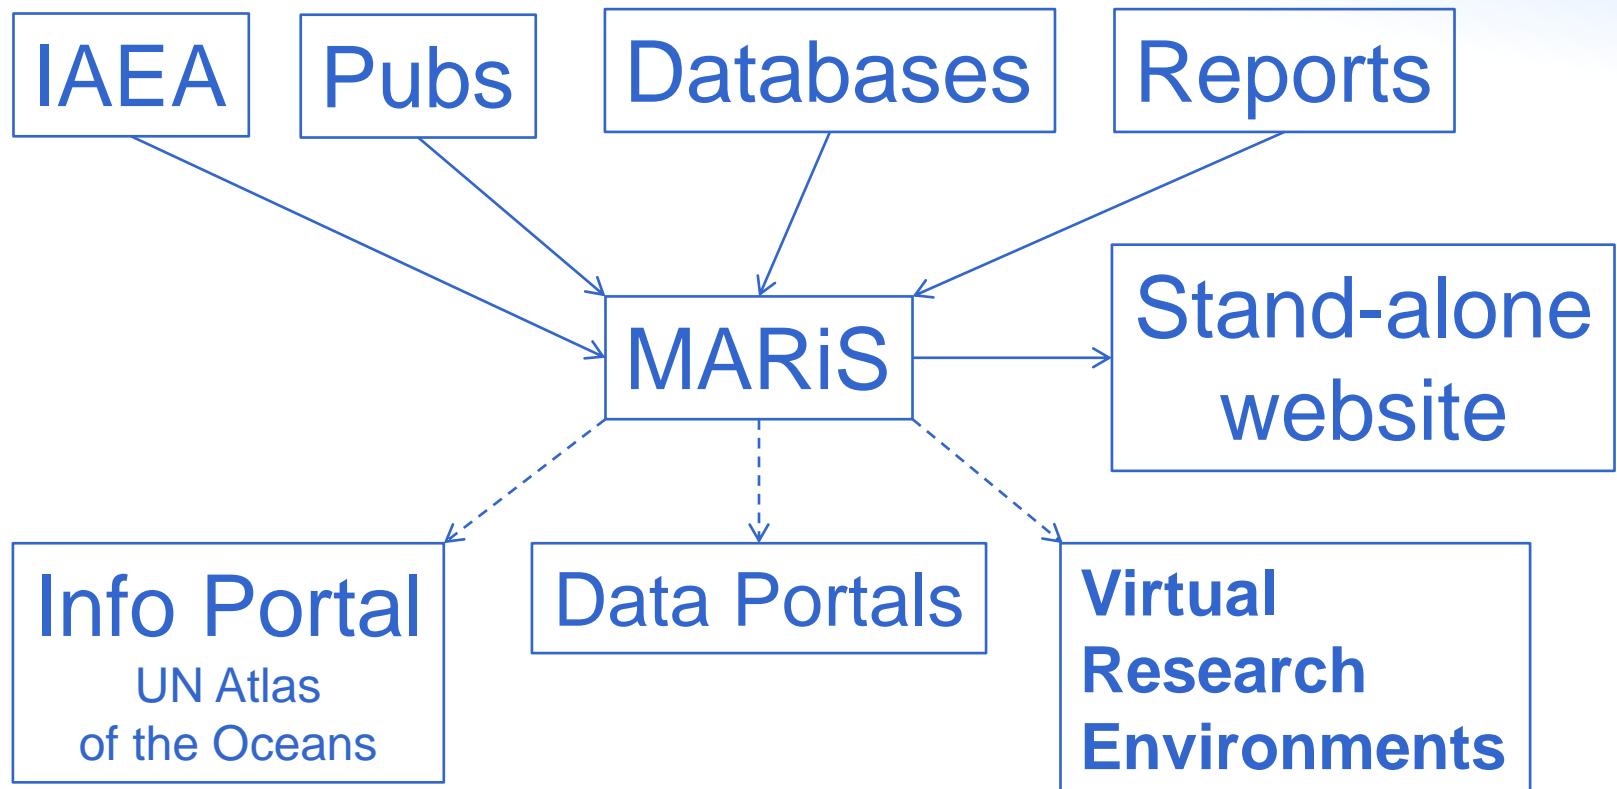

MARiS – data governance

- Data pathway or lifecycle
 - Data received from data provider/originated
 - Check to see if the data is already in MARiS
 - Import data and metadata in to MARiS
 - Document and archive the data reference
 - Serve the data to MARiS database users
 - Please cite the data provider/originator if you use data
 - A citation to MARiS is also encouraged

MARiS – data visualisation

- Tableau
 - Specialist data visualisation software under trial
 - In development and on trial for incorporation into MARiS website
 - 4 predefined visualisations for discovering what references, samples and measurements are contained in the MARiS database
 - Visit this link to see some example visualisation:
<http://public.tableau.com/profile/paul.mcginnity6639#/>

MARiS - data network

Links

- **MARiS** database website
- www.maris.iaea.org

- **Data visualisation** using Tableau under trial
- <http://public.tableau.com/profile/paul.mcginnity6639#!/>

- **User feedback** for MARiS database development
- <http://goo.gl/forms/gzVsJdq1Df>
- Link on MARiS homepage
- Your feedback will give us the power to develop MARiS
